

Gubiba Channel Diagnostic Report

Part 1: Current Position and Goals

Subject	Gubiba Channel on CHZZK
Analysis Period	February 2024 – June 2026
Data Scope	323-channel cohort + expanded pool of 860 channels, 24,056 broadcast records, 5 interviews
Date	2026-06-17

Key Terms

Term	Meaning in this report
CHZZK	The streaming platform where the Gubiba channel operates.
Cohort	A comparison group of similar channels used to judge relative performance.
Peak / avg viewers	Peak is the highest concurrent viewers; avg is average concurrent viewers.
Retention ratio	Average viewers divided by peak viewers; a proxy for how well viewers stay.
Efficiency	Viewer conversion relative to follower base, such as peak/follower.
Hybrid positioning	Operating across both variety gaming and virtual-streamer categories.
Inflection point	A follower range where viewer outcomes change noticeably.

◆ CONCLUSION CARD ①

The Gubiba channel is a “small but durable engine.” Three assets are already confirmed: a retention ratio in the top 14%, chat engagement 1.6–1.9× higher than the cohort, and alignment across the three layers of identity — self-perception, content, and audience. On the other hand, 711 followers places the channel below the cohort median, and even though 112 monthly broadcast hours are at the very top of the cohort, that input does not correlate with viewer growth. To move up in scale, **breaking through the 1,500-follower inflection point — not increasing broadcast volume** —is the first task.

§1. Channel Identity

The three layers of identity — self-perception, content, and audience perception — are almost perfectly aligned. This is a rare asset.

Layer	Core Point	Evidence of Alignment
Self-perception	"Clown-style entertainer" — light entertainment and attention/affection exchanged with viewers	Clear self-definition; awareness of the turning point from "streaming for the sake of streaming" to "streaming led by me"
Content	Variety gaming + virtual hybrid positioning, 12:00–15:00 slot, mainstream-friendly direction	Voluntary exclusion of adult-rated and pseudo-romantic content; self-named style "Gusori"
Audience	Teasing-based interaction; four nicknames: Gusajang, Gubabo, Kkuppippi, Kkusungi	"What I see and how the Ddaenggus see me are similar" — almost no gap

Channels where all three layers align are rare within the cohort. However, there is also a structural tension: the self-definition of "a hobby that feels like a full-time job" may conflict with monetization.

High

Cross-validated across five interviews and directly observed in the streamer's own statements.

§2. Comparison Group — Cohort Design

A channel’s numbers mean little in isolation. A comparison group is needed to judge whether the channel is actually performing well.

Cohort Composition

Cohort	No. of Channels	Selection Criteria	Role
T1 — Variety Gaming	184	CHZZK variety gaming channels, peak 12–45	Direct comparison group
T2 — Virtual	196	CHZZK virtual channels, peak 12–45	Hybrid comparison group
Overlap	57	Included in both cohorts	Hybrid channels
Unique Total	323		

In addition, 271 upper-band channels with 3,000–10,000 followers were collected as a reference for what happens as channel scale increases. The total analysis pool consists of 860 channels.

§3. Current Position Diagnosis

Gubiba fits the profile of a lower-to-mid scale channel with average efficiency, overwhelming activity volume, and top-tier retention. The follower base is below the cohort median, but viewers who enter tend to stay.

3.1 Four-Axis Positioning

Axis	Value	Position within T1	Interpretation
Viewer scale — median peak	20 viewers	Top 28%	Upper-mid
Follower base	711 followers	Lower to middle	Below cohort median
Efficiency — peak/follower	2.8%	Around median	Average
Broadcast input	112 hours/month	Top tier — 100th percentile	26× the cohort median

**Lower-mid scale + extreme input + strong retention
= need to convert efficiency**

Source: Softcon Viewership, cohort 323 channels | Confidence: High

Figure 1. Four-axis positioning radar — percentile within the T1 cohort (n=184)

3.2 Confirmed Strengths

Retention ratio of 0.712 — top 14% of the cohort. This is the ratio of average viewers to peak viewers. It means viewers who come in do not leave easily, and it is evidence of a stable viewer base that is not dependent on spikes.

Chat engagement is 1.6–1.9× higher. Chat volume is meaningfully higher than the cohort benchmark: Gubiba at 1,350–1,591 versus the cohort at 817–830. This confirms strong engagement among core viewers.

Effective use of hybrid positioning. Within the same follower range, variety-gaming-only channels have a median average viewer count of 8, while hybrid channels have 13. Gubiba records 14, indicating that the channel is making good use of the hybrid advantage.

High

Based on the full set of 585 broadcast records and directly calculated cohort percentiles.

3.3 Weaknesses to Watch

There is no positive correlation between broadcast volume and viewers. The correlation between broadcast hours and average viewers is $r = -0.315$, a weak negative correlation. Since Gubiba's 112

monthly hours are already at the top of the cohort, additional input is unlikely to produce meaningful returns.

The channel's scale is still small. 711 followers is below the cohort median. As the channel moves up in scale, efficiency naturally declines due to diminishing conversion, so maintaining the current efficiency while scaling will not be easy.

Very high

Consistently observed across the 323-channel cohort and the expanded pool of 860 channels.

3.4 Growth Trend — Two-Year Trajectory

All key indicators have risen together over the past two years, and average viewer growth (+57%) has outpaced follower growth (+51%).

Quarter	Median peak	Median avg	Median Chat	Followers
2024Q1	16	10.6	—	471
2024Q2	17	11.9	448	—
2024Q3	19	12.9	1,306	—
2024Q4	20	14.8	988	—
2025Q1	16	11.5	737	471
2025Q2	18	12.4	622	470
2025Q3	19	12.6	700	538
2025Q4	20	13.8	1,016	574
2026Q1	23	16.8	1,591	623
2026Q2	24	16.6	1,350	711

Indicator	Start	Current	Change
Average viewers	10.6	16.6	+57%
Followers	471	711	+51%
Peak viewers	16	24	+50%
Chat	448	1,350	+201%

Two-year growth: avg viewers +57%, chat engagement +201%

Source: Softcon Viewership + cohort 323 channels | Confidence: High

Figure 2. Growth trend — 10-quarter time series (2024Q1–2026Q2)

The +201% increase in chat signals a sharp rise in core viewer engagement. In particular, the channel achieved a level jump in 2026Q1–Q2, reaching peak 23–24.

High

Based on the full set of 585 broadcast records and quarterly aggregation. The figures are directly calculated from the data.

3.5 Baseline Scale vs. Spikes

The channel's baseline scale — peak 19 and avg 13 — accounts for 94% of broadcasts, and that baseline itself is steadily rising.

Category	Count	Median peak	Median avg	Median Chat
Baseline (94.2%)	548	19	13.0	919
Spikes (5.8%)	34	—	—	—

94% of broadcasts are baseline - and the baseline itself is rising

Source: 585 broadcast records; spike threshold peak ≥ 33.5 | Confidence: High

Figure 3. Baseline scale vs. spikes — the 94.2% baseline is the core

§4. Goal Analysis

4.1 Validating the Stated Goal — 10,000 Followers + 200 Average Viewers

The goal stated in the interviews — 10,000 followers and 200 average viewers — lies outside the range that can be validated with the current cohort data.

Indicator	Cohort Maximum	Stated Goal	Multiple
Followers	5,579	10,000	1.8×
Average viewers	31	200	6.5×

Among the 323 cohort channels, the number of channels with 50 or more average viewers is **zero**. Regression-based extrapolation estimates roughly 30 average viewers at 10,000 followers.

Reaching 200 average viewers is close to impossible.

Very high Across the cohort and expanded pool, there are zero channels with avg ≥ 50 . Regression $R^2 = 0.79$.

4.2 The Cost of Moving Up in Scale

As followers increase, efficiency — viewer conversion rate — naturally declines. This is a structural pattern observed across the full cohort.

Follower Range	Median Peak/Follower	Median Avg/Follower
~300	6.35%	3.9%
300-500	4.28%	2.6%
500-1K (current)	2.63%	1.5%
1K-3K (next range)	1.75%	1.1%
3K-5K	0.92%	0.7%

Efficiency falls by roughly 40% per follower range - the structural cost of scale

Figure 4. Efficiency decay curve — efficiency falls by roughly 40% per range

4.3 Cohort-Based Recommended Goals

Data-based goals to replace the 10,000 followers + 200 average viewers target.

Indicator	Current	Recommended Goal	Note
Followers	711	1,500~2,500	p50–p75 in the cohort's 1K–3K range
Median peak	20	27~35	p50–p75 in the same range
Median avg	14	17~21	p50–p75 in the same range
Retention ratio	0.712	Maintain 0.65+	Current top 14% → maintain at least top 30%

4.4 Alert Thresholds

Alert Indicator	Threshold	Meaning
Retention ratio < 0.60	Current 0.712 → below 0.60	The confirmed strength has disappeared

Peak < 21 at 1,000+ followers	p25 in the 1K-3K range	The channel scaled up, but viewers did not follow
eff_peak < 1.38%	p25 in the 1K-3K range	Follower-to-viewer conversion is in the bottom 25% of the range

§5. Peer Insights

Cross-cohort analysis identified three structural patterns: hybrid positioning advantage, broadcast volume irrelevance, and the 1,500-follower inflection point.

5.1 Hybrid Positioning Helps Secure Viewers

Group	n	Median avg	Share with avg ≥ 14
Variety gaming only	84	8	14%
Hybrid	37	13	41%
Virtual only	76	14	54%

Figure 5. Hybrid comparison — variety-gaming-only avg 8 vs. hybrid avg 13

Observed The pattern appears in the cohort, but causality — whether the virtual attribute is the cause — has not been separated.

5.2 Broadcast Volume Is Not the Answer

Broadcast Hours	Median Avg
0-50h	20
50-100h	13
100-200h	11
200-400h	9
400-1000h	8
1000h+	6

Figure 6. Broadcast volume vs. viewers — weak negative correlation ($r = -0.315$)

Very high

A consistent negative correlation appears across the cohort. However, this is not a causal claim that “reducing hours will increase viewers.”

5.3 1,500 Followers — The Inflection Point

Once a channel passes 1,500 followers, the probability of achieving avg ≥ 14 jumps from 28% to 83%.

Follower Band	Share with avg ≥ 14	Share with avg ≥ 20
500–1K (current)	28%	8%
1K–1.5K	45%	21%
1.5K–2.5K	83%	44%

After 1,500 followers, avg ≥ 14 probability jumps from 28% to 83%

Source: Softcon Viewership; cross-sectional pattern | Confidence: Observed

Figure 7. Probability by follower band — the 1,500-follower inflection point

Observed The inflection-point pattern appears in cross-sectional data, but it is correlation rather than causation.

5.4 Gubiba's Position Among Peers

Among the 197 channels in the peer band (500–1,500 followers):

- **Average viewers: top 31%**
- **Efficiency: top 15%**
- **Among the 10 nearest hybrid channels: 2nd in average viewers**

Gubiba is performing well for its current scale. However, "performing well" and "having sufficient room for growth" are separate issues.

§6. Recommended Actions + Next Steps

6.1 What Can Be Done Now — Ordered by Expected Impact

P1 Break through the 1,500-follower inflection point — Once the channel crosses this band, the probability of achieving $\text{avg} \geq 14$ jumps from 28% to 83%. The key is systematic use of external inflow channels such as YouTube and raids. (See §5.3)

P2 Maintain the afternoon schedule — The current 12:00–15:00 slot is the channel's best-performing time slot. Since evening (18:00–21:00) underperforms relative to the cohort, an intentional move into evening is not recommended. (See §3.3)

P3 Maintain the hybrid strategy — The variety gaming + virtual hybrid strategy provides a structural advantage in securing viewers. (See §5.1)

6.2 What Does Not Need to Be Done

- **Additional broadcast hours** — Already at the very top of the cohort (100th percentile). Additional input is unlikely to produce meaningful returns.
- **Setting 10,000 followers as a short-term goal** — The realistic next checkpoint is 1,500–2,500 followers.
- **Over-weighting spike-oriented events** — Since the baseline scale is steadily rising, maintaining baseline quality is more important.

6.3 Scope of Part 2

Part 1 covered "where the channel is now and how far it can go." Part 2 will cover "how to get there."

- **§7 Content Channel Effects** — Use of external channels such as YouTube, content strategy
- **§8 Execution Barrier Inventory** — Analysis of structural barriers that block execution
- **§9 Final Action Plan**

Limitations and Unresolved Items

1. The cohort's peak upper bound is 45, so it is not possible to verify whether the current pattern holds above that scale.
2. The cause of weak evening performance has not been separated between time slot and content.
3. The 1,500-follower inflection point is a cross-sectional observation, not a confirmed trajectory from the same channels as they gained followers.
4. The cause of the 2025Q1 dip has not been analyzed; it may be related to platform-level changes or internal channel factors.
5. The regression extrapolation — 10K followers → avg 30 — lies outside the observed cohort range (max 5,579), so precision is limited.
6. The causal direction of the negative correlation between broadcast hours and viewers has not been verified.

◆ CONCLUSION CARD ②

Gubiba's task is not to "stream more," but to "extract more value from the same broadcasts." A retention ratio of 0.712 (top 14%) and chat engagement 1.6–1.9× higher than the cohort are already validated assets. Based on these assets, **breaking through the 1,500-follower inflection point (\$5.3)** and **maintaining the hybrid strategy (\$5.1)** are the next checkpoints for entering the top 10–15% of the cohort.
